

The obvious use for terminal blocks is for making and organising electrical connections. However, the brass inserts can be removed and used as joiners for wire-in-tube control wires and links.

To remove the inserts:

Either remove the screws so that the inserts can be slid out.

Or cut the plastic across the bottom of each insert so that the inserts (with screws still in place) can be pulled out.

Another use is as a "Header" to secure multiple tube ends for wire-in-tube applications.
