

The switch in this pack is a lever-actuated momentary-action single-pole double-throw (changeover) switch and is suitable for switching the polarity of live frogs on model railway turnouts.

The terminals are clearly labelled COM (common), NC (normally closed), NO (normally open). While the lever is released, NC is connected to COM. While the lever is pressed, NO is connected to COM.

The photograph shows a demonstration setup using wire-in-tube point control (MODRATEC's Point-wit). Note that the baseboard is transparent for clarity.

For further information, please ask MODRATEC for a data sheet on Frog Polarity.
